Is cobalt a byproduct of nickel production in Indonesia? Cobalt is a byproduct of nickel production in Indonesia. Shortages of nickel have fuelled a rally that took prices to \$24,435 a tonne last month, the highest since August. DOES LITHIUM ALSO HAVE ESG ISSUES? Lithium mining also faces opposition from environmental and social activists. Are lithium and cobalt prices market-reflective? This includes benchmark prices for lithium and cobalt, two battery materials that continue to experience market volatility and supply/demand imbalances. Our widely used prices are market-reflective, assessing both the buy- and sell-side of transactions. How much cobalt does a cathode contain? BMI estimates cathodes can contain between 0-15 kg of cobalt, 0-40 kg of nickel and 30-50 kg of lithium. WHY CUT COBALT? One reason to cut cobalt content in EV batteries is cost - cobalt metal on the London Metal Exchange is trading at four-year highs around \$71,000 a tonne. Why do we cut cobalt in EV batteries? WHY CUT COBALT? One reason to cut cobalt content in EV batteries is cost - cobalt metal on the London Metal Exchange is trading at four-year highs around \$71,000 a tonne. Also, 50% of the world's cobalt reserves are in Democratic Republic of Congo where potential for political instability and disruption is high. Is nickel safe for EV batteries? And nickel also has ESG (environmental, social and governance) risks. Most new nickel units suitable for EV batteries will in future come from new high pressure acid leach (HPAL) plants in top producer Indonesia. Why are cobalt prices consolidated? In the weeks following confirmation that the cobalt market will face an additional three months of no exports from the Democratic Republic of Congo (DRC), metal prices have consolidated as participants point to the future for bullish sentiment. The downtrend is led by lithium where the sales weighted average value per EV is down 75% over the past year to \$236 and cobalt, which at little over \$46 is 42% below the value reached in The latest data based on EV registrations in over 110 countries show the sales weighted average monthly dollar value of the lithium, nickel, cobalt, manganese and graphite contained in the batteries of the average EV based on global end-user registrations, battery capacity and chemistries. Put it For instance, the article highlights that lithium nickel cobalt aluminum oxide (NCA) batteries have an average price of \$120.3 per kilowatt-hour (kWh), while lithium nickel cobalt manganese oxide (NCM) comes in slightly cheaper at \$112.7 per kWh. These batteries, rich in nickel, offer impressive Figure 1 presents the estimated cost for nickel manganese cobalt (NCM) 811 cells for a 10 gigawatt-hour per year production rate across four different countries. Figure 1 In the first quarter of , NCM 811 cell costs in China were estimated to be 101 dollars per kilowatt hour (kWh) and 110 This includes benchmark prices for lithium and cobalt, two battery materials that continue to experience market volatility and supply/demand imbalances. Our widely used prices are market-reflective, assessing both the buy- and sell-side of transactions. Trade with relied upon price data that is As natural and synthetic graphite, lithium carbonate and hydroxide, and nickel, cobalt and manganese sulphate prices decline further, the raw materials bill for the average EV is now down to \$510 compared to \$918 in October and a monthly peak of more than \$1,900 at the beginning of last year CHARTS: Nickel, cobalt, lithium price slump cuts The downtrend is led by lithium where the sales weighted
