What are base year costs for utility-scale battery energy storage systems? Base year costs for utility-scale battery energy storage systems (BESSs) are based on a bottom-up cost model using the data and methodology for utility-scale BESS in (Ramasamy et al.,). The bottom-up BESS model accounts for major components, including the LIB pack, the inverter, and the balance of system (BOS) needed for the installation. Do battery storage technologies use financial assumptions? The battery storage technologies do not calculate levelized cost of energy (LCOE) or levelized cost of storage (LCOS) and so do not use financial assumptions. Therefore, all parameters are the same for the research and development (R& D) and Markets & Policies Financials cases. How much does commercial battery storage cost? For large containerized systems (e.g., 100 kWh or more), the cost can drop to \$180 - \$300 per kWh. A standard 100 kWh system can cost between \$25,000 and \$50,000, depending on the components and complexity. What are the costs of commercial battery storage? Will storage futures lead to cost reductions in ? The Storage Futures Study report (Augustine and Blair,) indicates NREL, BloombergNEF (BNEF), and others anticipate the growth of the overall battery industry--across the consumer electronics sector, the transportation sector, and the electric utility sector--will lead to cost reductions in the long term. In this work we describe the development of cost and performance projections for utility-scale lithium-ion battery systems, with a focus on 4-hour duration systems. Storage cost projections are \$152/kWh, \$247/kWh, and \$349/kWh in and \$111/kWh, \$184/kWh, and \$333/kWh in for the low, mid, and high cases respectively. Battery variable operations and maintenance costs, lifetimes, and efficiencies are also discussed, with recommended values selected based In , the typical cost of a commercial lithium battery energy storage system, which includes the battery, battery management system (BMS), inverter (PCS), and installation, is in the following range: \$280 - \$580 per kWh (installed cost), though of course this will vary from region to region Research by Bain & Company estimates that by large-scale battery storage could be cost competitive with peaking power plants, which run when there is a high demand for electricity--and that is based only on cost, without any of the added value we expect companies and utilities to generate from This battery storage update includes summary data and visualizations on the capacity of large-scale battery storage systems by region and ownership type, battery storage co-located systems, applications served by battery storage, battery storage installation costs, and small-scale battery storage is shaping up to be the year when energy storage battery prices make lithium-ion cells cheaper than a Starbucks latte per kilowatt-hour. With prices for large-scale lithium iron phosphate (LFP) batteries plummeting 35% in alone [1], the industry's racing toward what analysts call the deployment and cost-reduction potential. By , total installed costs could fall between 50% and 60% (and battery cell costs by even more), driven by optimisation of manufacturing facilities, combined with better considerably more depending on duration. Looking at 100 MW systems, at a 2-hour Cost Projections for Utility-Scale Battery Storage: Update In this work we describe the development of cost and performance projections for utility-scale lithium-ion battery systems, with a focus on 4-hour duration systems.
