This transformation process needs to be highly dynamic if the developmen battery value chain, the European Battery Alliance (EBA) was founded. Additionally, two Important Projects of Common European Interest (IPCEIs) were nickel, manganese, cobalt and graphite for battery cell manufacturin nternational cooperation to secure the supply of metals for batteries. Against the background of rising internatio al tensions, resilient supply chains are thus becoming more important. It is therefore tremendously important for Lithium-ion (Li-ion) EV battery prices have decreased dramatically over the past few years, mainly due to the fall in prices of critical battery metals: Lithium, cobalt and nickel. For example, the price of cobalt has fallen from roughly \$70,000 per metric ton in to about \$30,000 in . The largest single contributor to the cost of battery cells is the materials used in them, especially the cathode materials. In addition to lithium, the transition metals manganese, iron, cobalt and nickel are used in particular. At the beginning of the value chain is the mining of raw materials In the Democratic Republic of Congo, which produces 64% of the global cobalt supply, demand is expected to grow by 7.5% annually until , despite it playing a decreasing role in battery chemistry. Challenges associated with cobalt include ethical sourcing and price instability, intensifying the In order to achieve a relevant market potential for high-performance ve-hicles with solid-state batteries, cell costs of less than 100 EUR2020/kWh are con-sidered necessary based on the currently implemented willingness-to-pay factors and the expected improvements in conventional batteries with This study presents a comprehensive analysis of projected produc-tion costs for lithium-ion batteries by , focusing on essential metals. It explores the complex interplay of factors, including economies of scale, R& D innovations, market dynam-ics, and metal price trends.
